

# FAQ: HELP! My Spring MVC Controller is not working. What to do?

JUST A HEADS UP ...

IN THE VIDEOS YOUR SPRING MVC CONTROLLER CODE MAY NOT WORK

THIS IS AN ECLIPSE CACHING BUG

IF YOUR CONTROLLER DOESN'T WORK THEN TRY THE STEPS BELOW

----

**Question:** HELP! My Spring MVC Controller is not working. What to do?

**Answer:**

***Debug Tip #0: Make sure you are accessing the correct URL***

You need to access the correct URL, localhost:8080/spring-mvc-demo/

Note: Do not attempt to run the JSP files directly. This will not work due to MVC.

---

***Debug Tip #1: Make Sure your Package Names is consistent***

The Spring configuration file used in the videos expects for your controller to be in the package:

***package com.luv2code.springdemo.mvc;***

*Make sure your controller is this package.*

----

### ***Debug Tip #2: Reimport Project into Eclipse***

Sometimes the Eclipse project settings can become corrupted. One possible solution is to remove the Eclipse project and reimport into Eclipse.

Here are the steps.

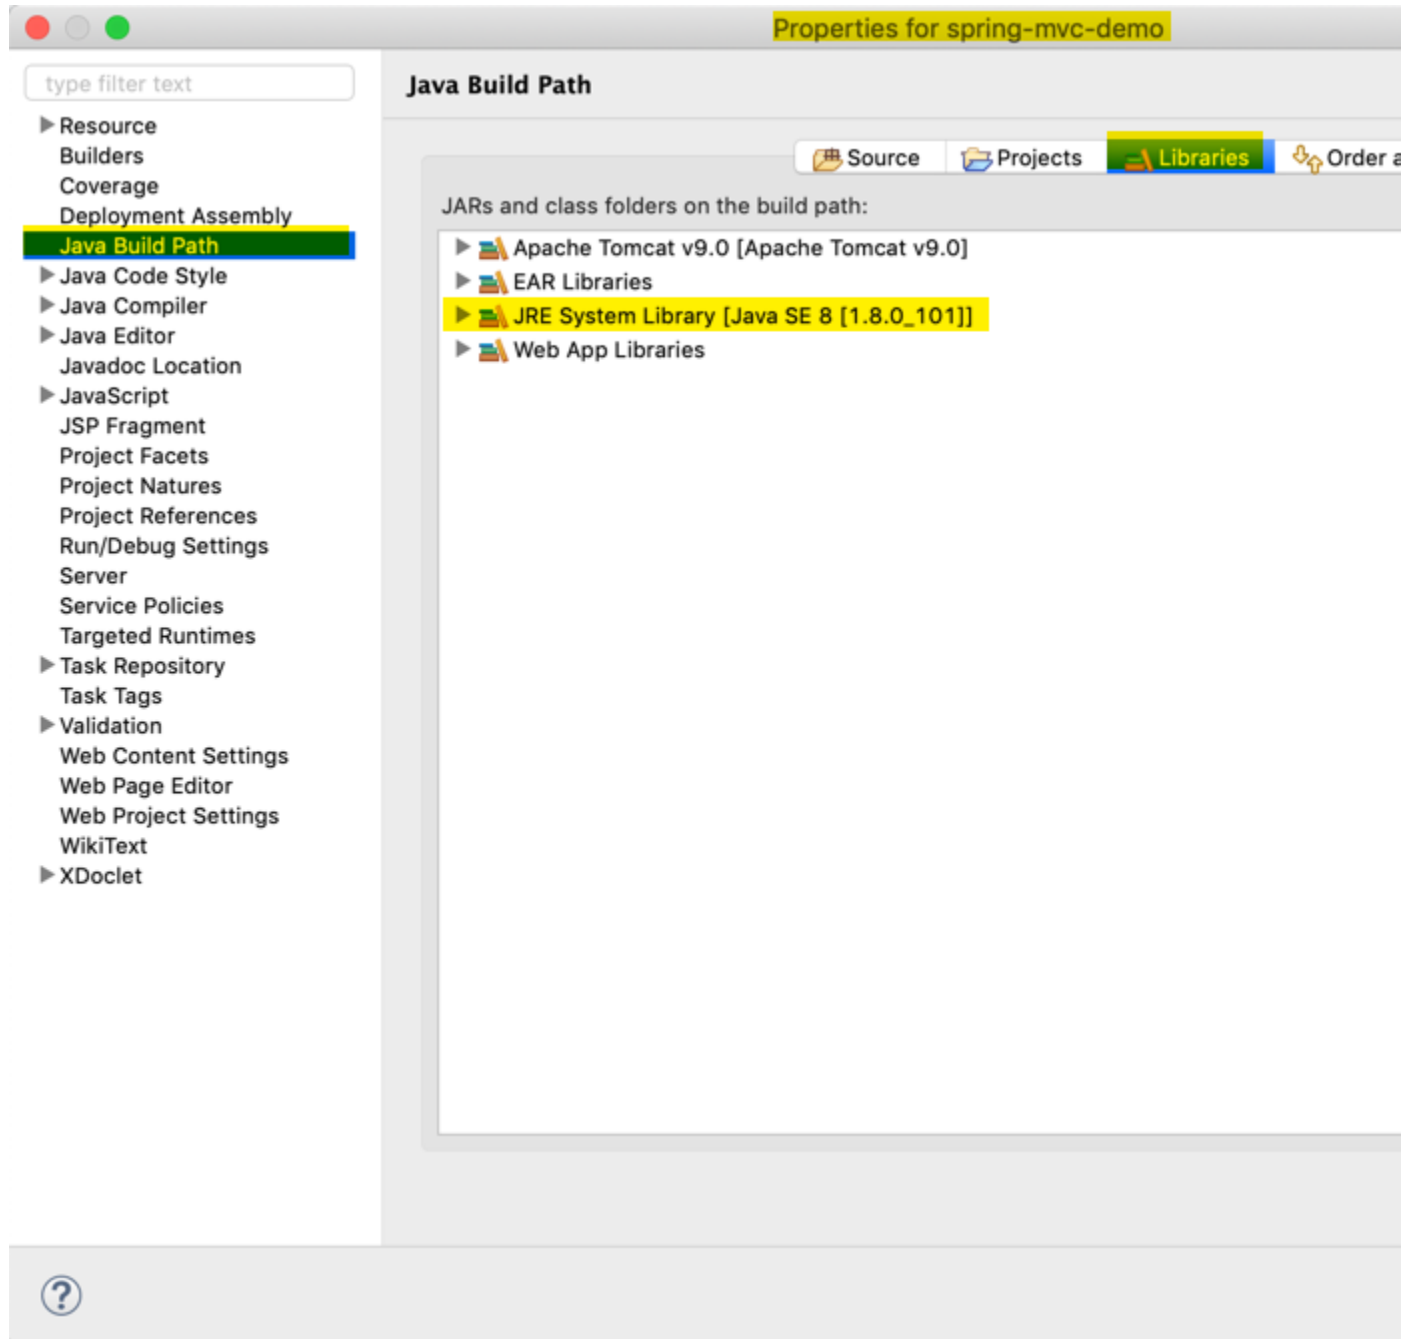

1. Remove the project from Eclipse.

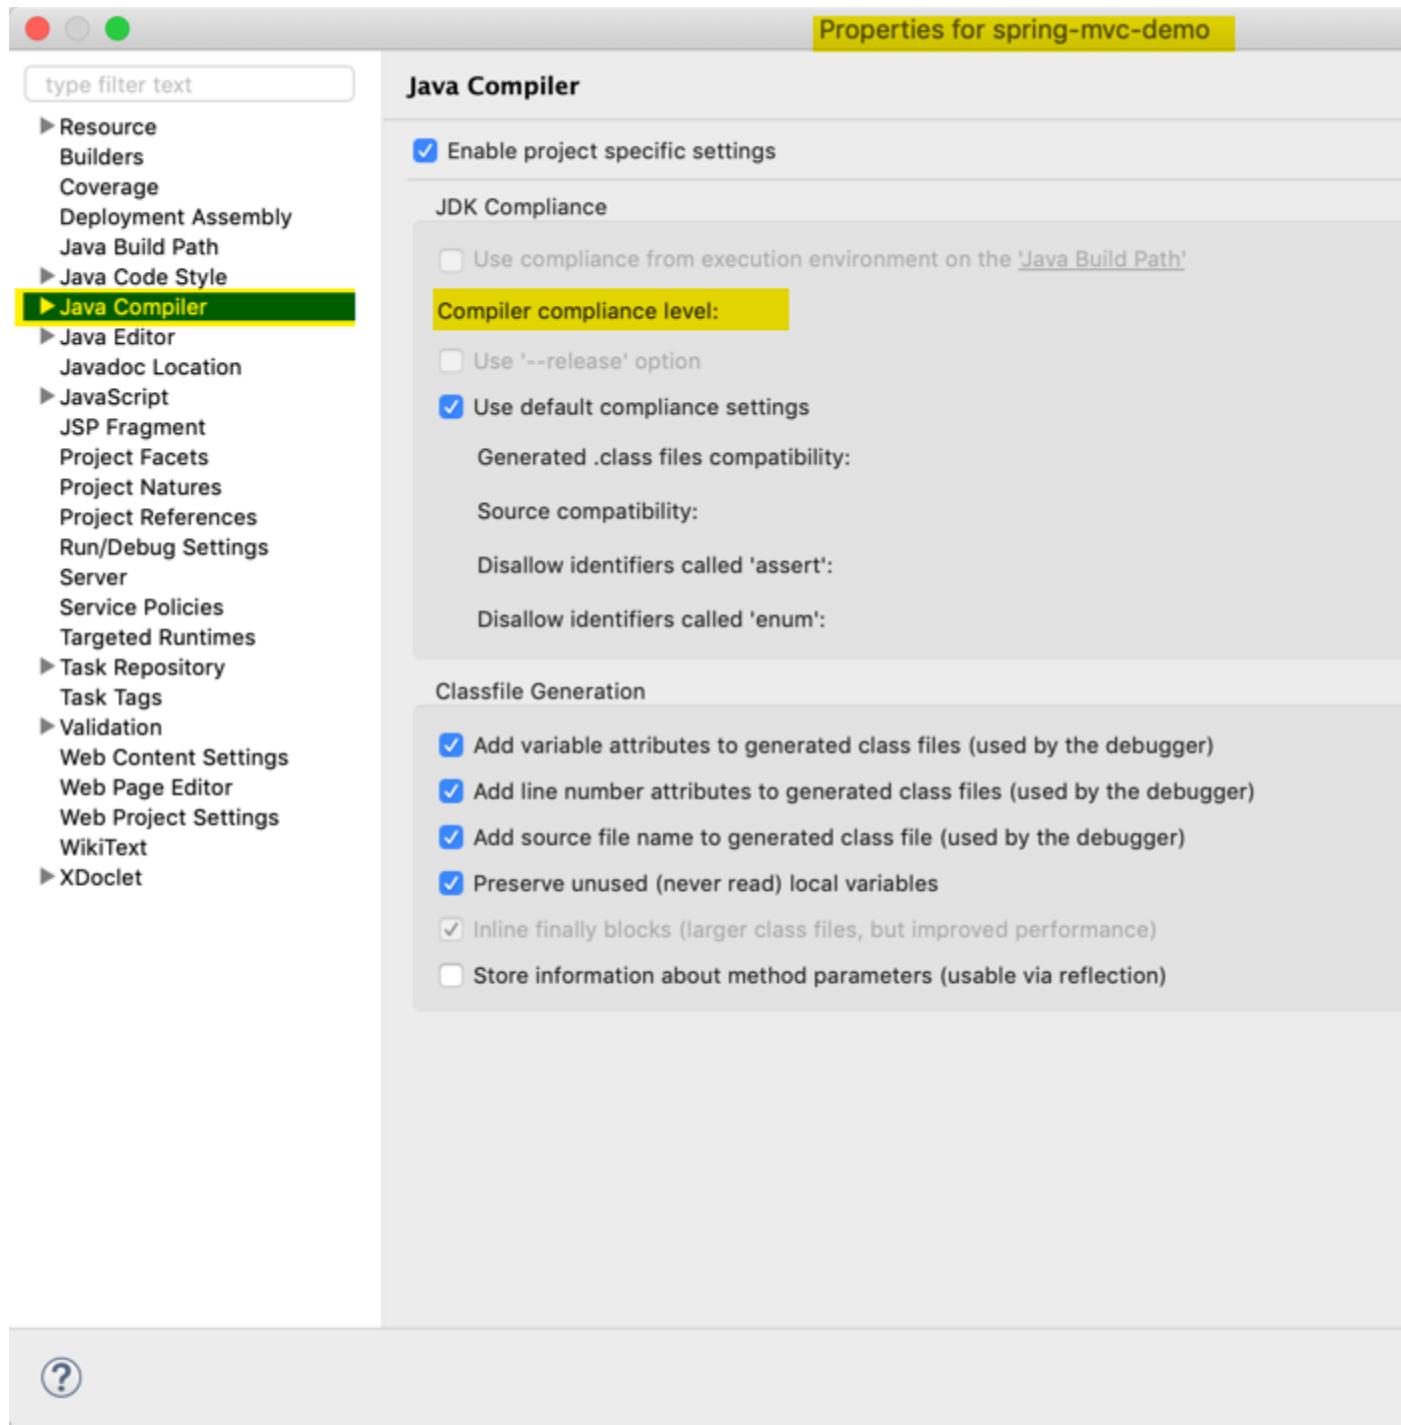

2. Open the project in file system and remove the files/ folders except src and WebContent.

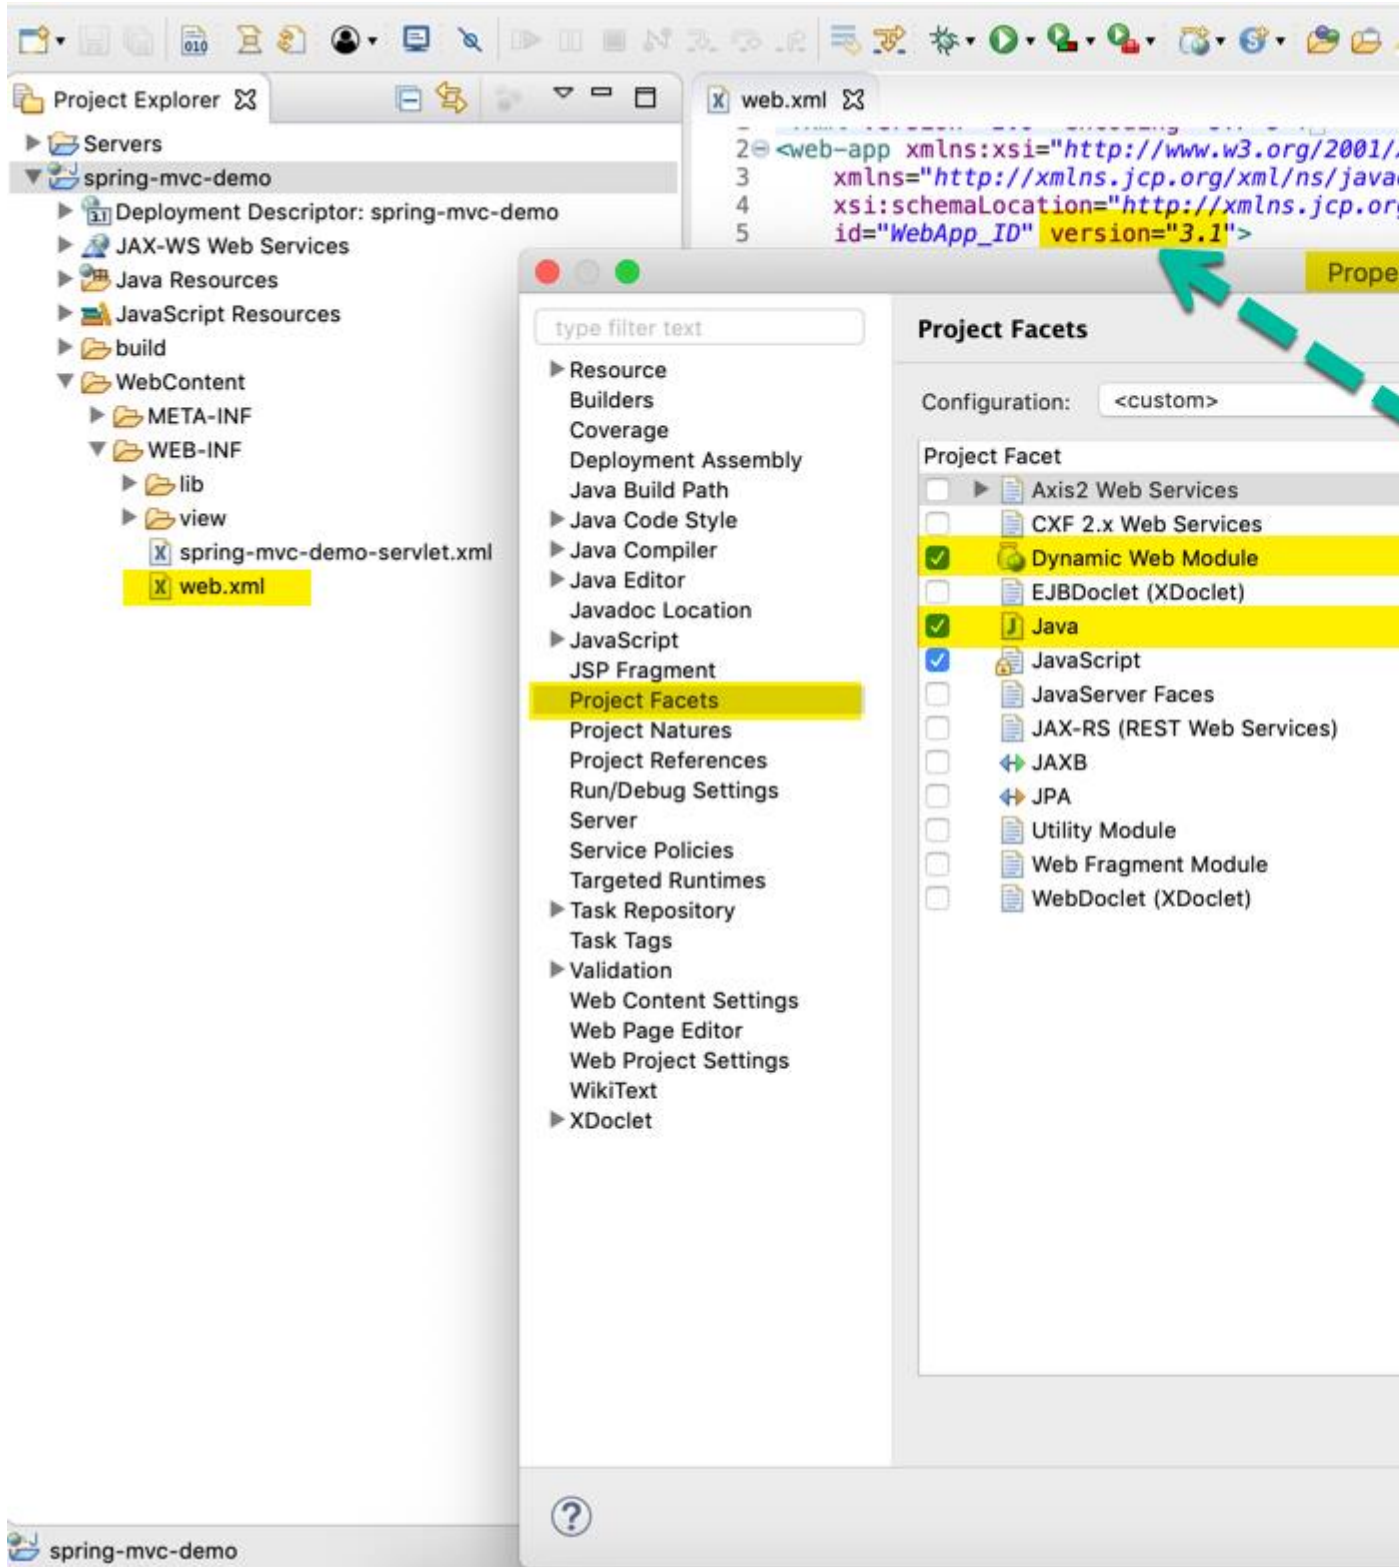

3. Open the project in Eclipse again using **File > Import ... > General > Existing Projects into Workspace**
4. Check the project properties(Right click on the project and click on Properties),
5. Check the Java Build Path, Java Compiler and Project Facets and make sure that the Java version is same in all the windows.

5. Build the project and try again.

----

### ***Debug Tip #3: Clear Tomcat Cache***

This is normally a caching issue with the cache.

Here are some steps to clear the Eclipse cache and Tomcat cache.

1. In the Server's tab in Eclipse, Stop the Tomcat server
2. Right-click the server and select "Clean..."
3. Right-click the server again and select "Clean Tomcat Work Directory..."

---

4. In the Eclipse, select the top-level menu option, Project > Clean ...
5. Be sure your project is selected and click Ok
6. Restart Eclipse

Retest your application. If you continue to have problems try Debug Tip #2

---

### ***Debug Tip #4: Import the Project in a new workspace***

1. Copy your project to a new directory on your computer like, c:\foobar
2. In Eclipse, open a new workspace: Create a new workspace in Eclipse: File > Switch Workspace > Other ... > give any name
3. In Eclipse, import the project
  - 3a. Use File > Import > General > Existing Projects into Workspace
  - 3b. Browse to directory: c:\foobar
4. In your new workspace, add a reference to the Tomcat server

## 5. Test your app in the new workspace

---

If you still have problems, then post your code to the classroom discussion forum.

Be sure to include the following files:

- spring-mvc-demo-servlet.xml
- your controller .java
- your view page .jsp
